  - What are we trying to measure?
  - Select a model and train it.
  - Validate that the model is measuring what we want and that there are no clear confounders.
- 4. Empirical analysis
  - Produce statistics or predictions with the trained model.
  - Answer the research question.

"Attitudes that affect our understanding, actions, and decisions in an unconscious manner" (Kirnan institute, OSU)

"Attitudes that affect our understanding, actions, and decisions in an unconscious manner" (Kirnan institute, OSU)

► Generally measured using Implicit Association Tests (IATs)

"Attitudes that affect our understanding, actions, and decisions in an unconscious manner" (Kirnan institute, OSU)

- Generally measured using Implicit Association Tests (IATs)
- Subjects asked to assign words to categories (Greenwald et al. 1998)

- Comparing reaction times across trials with different word pairs:
  - subjects tend to be slower and more error-prone in assignments against stereotype (e.g. "Michelle" goes to "Female or Career").

"Attitudes that affect our understanding, actions, and decisions in an unconscious manner" (Kirnan institute, OSU)

- Generally measured using Implicit Association Tests (IATs)
- Subjects asked to assign words to categories (Greenwald et al. 1998)

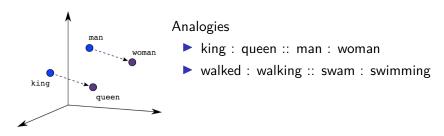

- Comparing reaction times across trials with different word pairs:
  - ▶ subjects tend to be slower and more error-prone in assignments against stereotype (e.g. "Michelle" goes to "Female or Career").
  - ▶ IAT score = difference in reaction time between stereotype-consistent and stereotype-inconsistent rounds.

# Caliskan, Bryson, and Narayanan (*Science* 2017)

▶ "We replicated a spectrum of known biases, as measured by the Implicit Association Test, using a widely used, purely statistical machine-learning model trained on a standard corpus of text from the World Wide Web. . . "

# Caliskan, Bryson, and Narayanan (*Science* 2017)

"We replicated a spectrum of known biases, as measured by the Implicit Association Test, using a widely used, purely statistical machine-learning model trained on a standard corpus of text from the World Wide Web. . . "

## Measuring Gender Stereotypes using Cosine Similarity

## Example Stimuli

#### ► Targets:

- ► Flowers: aster, clover, hyacinth, marigold, poppy, azalea, crocus, iris, orchid, rose, bluebell, daffodil, lilac, pansy, tulip, buttercup, daisy, lily, peony, violet, carnation, gladiola, magnolia, petunia, zinnia.
- ▶ Insects: ant, caterpillar, flea, locust, spider, bedbug, centipede, fly, maggot, tarantula, bee, cockroach, gnat, mosquito, termite, beetle, cricket, hornet, moth, wasp, blackfly, dragonfly, horsefly, roach, weevil.

# Example Stimuli

#### ► Targets:

- ▶ Flowers: aster, clover, hyacinth, marigold, poppy, azalea, crocus, iris, orchid, rose, bluebell, daffodil, lilac, pansy, tulip, buttercup, daisy, lily, peony, violet, carnation, gladiola, magnolia, petunia, zinnia.
- ▶ Insects: ant, caterpillar, flea, locust, spider, bedbug, centipede, fly, maggot, tarantula, bee, cockroach, gnat, mosquito, termite, beetle, cricket, hornet, moth, wasp, blackfly, dragonfly, horsefly, roach, weevil.

#### Attributes:

- ▶ Pleasant: caress, freedom, health, love, peace, cheer, friend, heaven, loyal, pleasure, diamond, gentle, honest, lucky, rainbow, diploma, gift, honor, miracle, sunrise, family, happy, laughter, paradise, vacation.
- ▶ **Unpleasant**: abuse, crash, filth, murder, sickness, accident, death, grief, poison, stink, assault, disaster, hatred, pollute, tragedy, divorce, jail, poverty, ugly, cancer, kill, rotten, vomit, agony, prison.

- ▶ Pleasant vs. Unpleasant?
  - ► Flowers vs. Insects
  - Musical instruments vs. weapons.

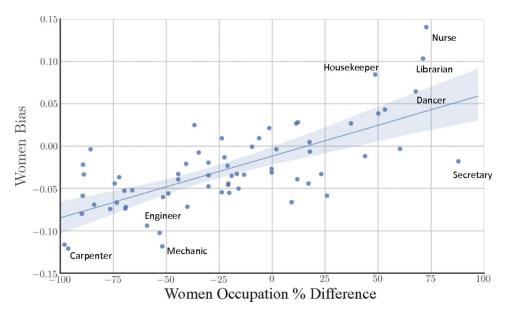

- ▶ Pleasant vs. Unpleasant?
  - Flowers vs. Insects
  - Musical instruments vs. weapons.
  - European-American names vs. African-American names

- ▶ Pleasant vs. Unpleasant?
  - Flowers vs. Insects
  - Musical instruments vs. weapons.
  - European-American names vs. African-American names
- ▶ Male names vs. Female names:

- ► Pleasant vs. Unpleasant?
  - Flowers vs. Insects
  - Musical instruments vs. weapons.
  - European-American names vs. African-American names
- ► Male names vs. Female names:
  - ► Career words (e.g. professional, corporation, ...) vs. family words (e.g. home, children, ...)
  - Math/science words vs arts words

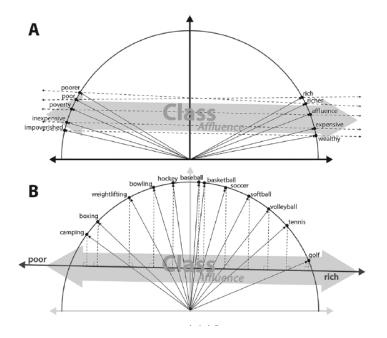

What do we learn from this?

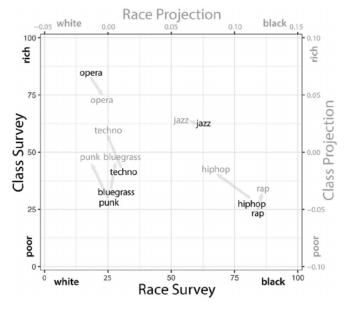

# Garg, Schiebinger, Jurafsky, and Zou (PNAS 2018)

Women's occupation relative percentage vs. embedding bias in Google News vectors.

# Kozlowski, Evans, and Taddy (ASR 2019)

**Figure 3.** Projection of Music Genres onto Race and Class Dimensions of the Google News Word Embedding (Gray) and Average Survey Ratings for Race and Class Associations (Black)

# Time Series Analysis of Affluence

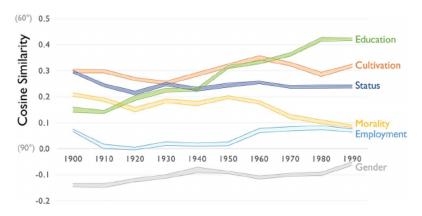

Figure 5. Cosine Similarity between the Affluence Dimension and Six Other Cultural Dimensions of Class by Decade; 1900 to 1999 Google Ngrams Corpus Note: Bands represent 90 percent bootstrapped confidence intervals produced by subsampling.

<sup>&</sup>quot;Among the 10 nouns most highly projecting on the affluence dimension in the first decade of the twentieth century are "fragrance," "perfume," "jewels," and "gems," ..."

- ▶ What are we measuring?
  - e.g., how do measurements by person or by group correlate with actual attitudes, for example as measured by IAT scores?

- What are we measuring?
  - e.g., how do measurements by person or by group correlate with actual attitudes, for example as measured by IAT scores?
- What attitudes can be reliably measured?
  - e.g. racial sentiment, especially in light of black sheep problem.

- What are we measuring?
  - e.g., how do measurements by person or by group correlate with actual attitudes, for example as measured by IAT scores?
- What attitudes can be reliably measured?
  - e.g. racial sentiment, especially in light of black sheep problem.
- In what domains is this relevant?
  - social media, news media, politics, legal, scientific, ...

### NLP "Bias" is statistical bias

➤ Sentiment scores that are trained on annotated datasets also learn from the correlated non-sentiment information.

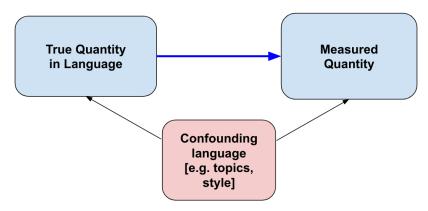

#### NLP "Bias" is statistical bias

➤ Sentiment scores that are trained on annotated datasets also learn from the correlated non-sentiment information.

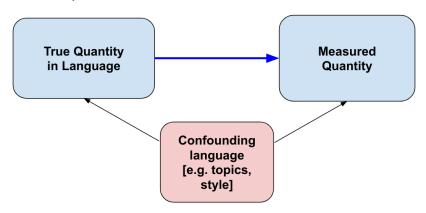

- Supervised sentiment models are confounded by correlated language factors.
  - e.g., in the training set maybe people complain about Mexican food more often than Italian food.

### This is a universal problem

- supervised models (classifiers, regressors) learn features that are correlated with the label being annotated.
- unsupervised models (topic models, word embeddings) learn correlations between topics / contexts.

### This is a universal problem

- ▶ supervised models (classifiers, regressors) learn features that are correlated with the label being annotated.
- unsupervised models (topic models, word embeddings) learn correlations between topics / contexts.
- An important exception: dictionary methods (perhaps explaining why they are often used by economists). But they have other serious limitations.

What quantity do we care about? vs. What do we measure?

What quantity do we care about? vs. What do we measure?

- Positive/negative sentiment → Count positive/negative words, or predict text annotations.
- ► Toxicity → Count toxic words, or predict text annotations.

#### What quantity do we care about? vs. What do we measure?

- Positive/negative sentiment  $\rightarrow$  Count positive/negative words, or predict text annotations.
- lacktriangle Toxicity ightarrow Count toxic words, or predict text annotations.

#### confounders?

- lacktriangle Student performance ightarrow predicted essay grade based on labeled essay documents.
- ▶ Credit worthiness → predicted probability of default based on loan application documents.

#### What quantity do we care about? vs. What do we measure?

- Positive/negative sentiment  $\rightarrow$  Count positive/negative words, or predict text annotations.
- ► Toxicity → Count toxic words, or predict text annotations.

#### confounders?

- lacktriangle Student performance ightarrow predicted essay grade based on labeled essay documents.
- ► Credit worthiness → predicted probability of default based on loan application documents.

#### confounders?

 $lackbox{
ightharpoonup}$  Political partisanship ightarrow predicted probability being Democrat/Republican based on speeches.

#### What quantity do we care about? vs. What do we measure?

- ightharpoonup Positive/negative sentiment ightharpoonup Count positive/negative words, or predict text annotations.
- lackbox Toxicity ightarrow Count toxic words, or predict text annotations.

#### confounders?

- lacktriangle Student performance ightarrow predicted essay grade based on labeled essay documents.
- ▶ Credit worthiness → predicted probability of default based on loan application documents.

#### confounders?

lackbox Political partisanship ightarrow predicted probability being Democrat/Republican based on speeches.

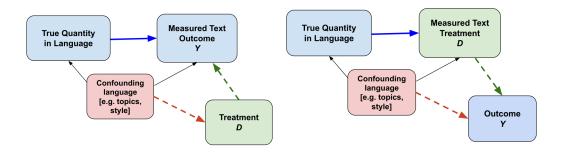

#### confounders?

Policy priorities → predicted probability of speeches/laws being about a particular policy topic.

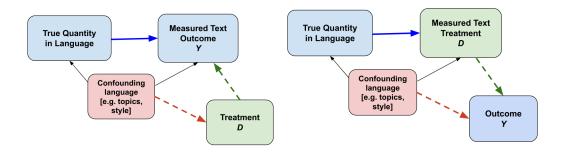

- By itself, producing measurements that are biased by confounders might not be a problem.
- e.g.:
  - ightharpoonup an NLP-based credit score that learns confounders ightharpoonup not a problem unless debtors learn about it and strategically alter their documents.
    - similarly with automated essay grading

- By itself, producing measurements that are biased by confounders might not be a problem.
- e.g.:
  - ightharpoonup an NLP-based credit score that learns confounders ightharpoonup not a problem unless debtors learn about it and strategically alter their documents.
    - similarly with automated essay grading
- for measuring political divisiveness or policy priorities
  - probably won't matter for in-domain summary statistics
  - but would matter a lot for summary statistics in a new domain

- By itself, producing measurements that are biased by confounders might not be a problem.
- e.g.:
  - ightharpoonup an NLP-based credit score that learns confounders ightharpoonup not a problem unless debtors learn about it and strategically alter their documents.
    - similarly with automated essay grading
- for measuring political divisiveness or policy priorities
  - probably won't matter for in-domain summary statistics
  - but would matter a lot for summary statistics in a new domain
- even in domain, will matter for assessing the causal effect of a treatment, e.g. the electoral cycle:
  - elections might cause politicians to focus on social issues rather than economic issues.
  - if social/economic issues are confounded with partisanship, the resulting estimates are biased.

- When text is outcome, the confounders cannot be correlated with the treatment.
- ▶ When text is treatment, the confounders cannot be correlated with the outcome.

- When text is outcome, the confounders cannot be correlated with the treatment.
- When text is treatment, the confounders cannot be correlated with the outcome.
  - e.g.: estimating the effect of politician speech sentiment on his/her reelection chances?

### Steps for de-biasing

- Language features that are often confounded with the quantity of interest:
  - stopwords
  - named entities: person/organization/place names
- These can be dropped during pre-processing to reduce the influence of confounders in subsequent measurements.
- ▶ Can control for topic or style features or other potential confounders in regressions.

- ▶ Bolukbasi et al (NIPS 2016):
  - "Geometrically, gender bias is first shown to be captured by a direction in the word embedding."

- ▶ Bolukbasi et al (NIPS 2016):
  - "Geometrically, gender bias is first shown to be captured by a direction in the word embedding."
  - "Second, gender neutral words are shown to be linearly separable from gender definition words in the word embedding."

- ► Bolukbasi et al (NIPS 2016):
  - "Geometrically, gender bias is first shown to be captured by a direction in the word embedding."
  - "Second, gender neutral words are shown to be linearly separable from gender definition words in the word embedding."
  - "Using these properties, we provide a methodology for modifying an embedding to remove gender stereotypes, such as the association between the words receptionist and female, while maintaining desired associations such as between the words queen and female."

- Bolukbasi et al (NIPS 2016):
  - "Geometrically, gender bias is first shown to be captured by a direction in the word embedding."
  - "Second, gender neutral words are shown to be linearly separable from gender definition words in the word embedding."
  - "Using these properties, we provide a methodology for modifying an embedding to remove gender stereotypes, such as the association between the words receptionist and female, while maintaining desired associations such as between the words queen and female."
- ▶ But: Gonen and Goldberg (2019):
  - "... we argue that this removal is superficial. While the bias is indeed substantially reduced according to the provided bias definition, the actual effect is mostly hiding the bias, not removing it. The gender bias information is still reflected in the distances between 'gender-neutralized' words in the debiased embeddings, and can be recovered from them..."
- Project idea: use double machine learning to de-bias word embeddings.

### Embedding approach:

- low-dimensional dense vectors rather than high-dimensional sparse vectors
- Embedding without neural nets:
  - ▶ PCA reductions of the document-term matrix
  - LDA topic shares
- Embedding with neural nets (today):
  - many useful ways to do this.

# Embedding layers can produce document embeddings

► Embedding layers take a categorical variable as input and produce a low-dimensional dense representation.

# Embedding layers can produce document embeddings

► Embedding layers take a categorical variable as input and produce a low-dimensional dense representation.

Can be used to produce document embeddings:

- ► Tokenize document to fixed length n<sub>L</sub>
- ▶ Inputs are each word position, input categorical (word) to  $n_E$ -dimensional embedding layer:

pipe to further hidden layers of network.

### Embedding layers can produce document embeddings

► Embedding layers take a categorical variable as input and produce a low-dimensional dense representation.

Can be used to produce document embeddings:

- ► Tokenize document to fixed length n<sub>L</sub>
- Inputs are each word position, input categorical (word) to  $n_E$ -dimensional embedding layer:

- pipe to further hidden layers of network.
- **b** document embedding =  $n_L n_E$ -dimensional vector of concatenated word embeddings.
  - computationally demanding and only works with short documents.

### Autoencoder Encodings

- ▶ Autoencoder compresses a document (e.g. a sentence) into a vector to be reconstructed.
  - Can use the compressed representation as a document embedding.
- ▶ Standard (that is, non-transformer) autoencoder embeddings don't tend to work well for sentence similarity tasks because autoencoders try to reproduce the specific wording (reconstruction objective), rather than the semantic meaning.
  - transformer-based autoencoders, e.g. BART, address this issue (Week 9)

### **Document Embeddings**

Aggregated Word/Phrase Embeddings

Doc2Vec StarSpace

### Word Vectors can produce Document Vectors

$$\vec{D} = \sum_{w \in D} a_w \vec{w}$$

- The "continuous bag of words" representation for document D is the sum, or the average (potentially weighted by  $a_w$ ), of the vectors  $\vec{w}$  for each word w in the document.
  - word vectors  $\vec{w}$  constructed using Word2Vec or GloVe (pre-trained or trained on the corpus).
  - "Document" could be sentence, paragraph, section, etc.

### Word Vectors can produce Document Vectors

$$\vec{D} = \sum_{w \in D} a_w \vec{w}$$

- The "continuous bag of words" representation for document D is the sum, or the average (potentially weighted by  $a_w$ ), of the vectors  $\vec{w}$  for each word w in the document.
  - word vectors  $\vec{w}$  constructed using Word2Vec or GloVe (pre-trained or trained on the corpus).
  - "Document" could be sentence, paragraph, section, etc.
- ➤ Arora, Liang, and Ma (2017) provide a "tough to beat baseline", the SIF-weighted ("smoothed inverse frequency") average of the vectors:

$$a_{w} = \frac{\alpha}{\alpha + p_{w}}$$

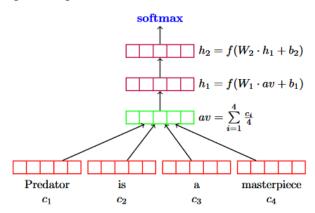

where  $p_w$  is the probability (frequency) of the word and  $\alpha = .001$  is a smoothing parameter.

# Deep Averaging Network (lyyer et al 2015)

➤ Similar to the previous aggregated word embedding methods, but embeddings are learned during training:

# Deep Averaging Network (lyyer et al 2015)

➤ Similar to the previous aggregated word embedding methods, but embeddings are learned during training:

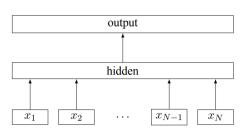

- 1. Trainable embedding layer for words, initialized with pre-trained embeddings
- 2. Average the embeddings, with dropout (sometimes words left out of average)
- 3. Average embedding fed into MLP with multiple hidden layers
- 4. MLP outputs used for classification or regression

# fastText: Hashed N-Gram Embeddings (Joulin et al 2016)

Combines the lyyer et al (2015) approach with the hashing n-gram vectorizer.

# fastText: Hashed N-Gram Embeddings (Joulin et al 2016)

Combines the lyyer et al (2015) approach with the hashing n-gram vectorizer.

**Figure 1:** Model architecture of fastText for a sentence with N ngram features  $x_1, \ldots, x_N$ . The features are embedded and averaged to form the hidden variable.

- 1. Allocate  $n_w \approx 10$  million rows to embedding matrix.
- 2. Assign n-grams to embedding indexes with hashing function.
- sentence embedding = average of n-gram embeddings
- 4. send to dense hidden layer(s)
- send to output (e.g. classifier / regressor).

Captures the local predictive power of n-grams without building vocabulary or costly training of CNN.

### Doc2Vec (Le and Mikolov)

Recall that Word2Vec trains word embeddings to predict a word given neighboring context words:

Doc2Vec augments Word2Vec with a categorical embedding for the document (e.g. paragraph):

# Doc2Vec on Wikipedia (Dai, Olah, and Le 2015)

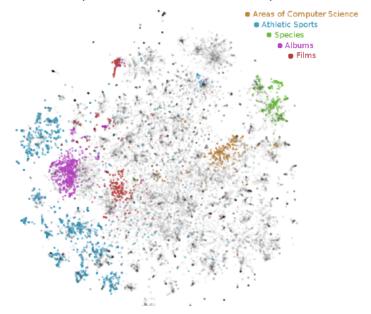

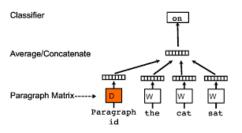

Figure 3: Visualization of Wikipedia paragraph vectors using t-SNE.

### Vectorizing New Documents

- A new document that wasn't in training does not have a vector.
- Document inference step:
  - freeze word embeddings in input layer and in output layer.
  - learn embedding for new document to predict sampled words in new document.

### **Document Embeddings Geometry**

- ▶ With topic models, each dimension has a topical interpretation.
- ▶ With document embeddings, a direction (might) have a topical interpretation.

### **Document Embeddings Geometry**

- ▶ With topic models, each dimension has a topical interpretation.
- ▶ With document embeddings, a direction (might) have a topical interpretation.
- Analogous with word embeddings, directions in document embedding capture analogous dimensions of documents:

Table 2: Wikipedia nearest neighbours

(a) Wikipedia nearest neighbours to "Lady Gaga" using Paragraph Vectors. All articles are relevant. (b) Wikipedia nearest neighbours to "Lady Gaga" - "American" + "Japanese" using Paragraph Vectors. Note that Ayumi Hamasaki is one of the most famous singers, and one of the best selling artists in Japan. She also has an album called "Poker Face" in 1998.

# Doc2Vec for Judicial Opinions (Ash and Chen 2018)

- ► Corpus: 300,000 cases from U.S. Circuit Courts, 1870-2010.
- ▶ Produce document vectors for each case to understand differences between judges and courts.

# Doc2Vec for Judicial Opinions (Ash and Chen 2018)

- Corpus: 300,000 cases from U.S. Circuit Courts, 1870-2010.
- ▶ Produce document vectors for each case to understand differences between judges and courts.
- ▶ De-mean vectors by group (court, topic, or year) to extract relevant information:
  - de-mean by topic-year to distinguish courts.
  - de-mean by court-topic to distingush years.
  - de-mean by court-year to distinguish topics.

### Outline

#### Bias in Language

Bias in Language: Social Science Applications Bias in NLP Systems

#### **Document Embeddings**

Aggregated Word/Phrase Embeddings Doc2Vec

 ${\sf StarSpace}$ 

StarSpace: Embed Anything (Wu et al 2018)

Generalize two key embedding ingredients from NLP to much broader set of tasks:

# StarSpace: Embed Anything (Wu et al 2018)

Generalize two key embedding ingredients from NLP to much broader set of tasks:

- 1. aggregate embeddings across words or phrases by document  $\rightarrow$  aggregate embeddings across features by entity
- 2. negative sampling of co-locating words vs random words  $\rightarrow$  negative sampling of related entities vs unrelated entities

#### **Entities and Features**

- features are categorical variables.
  - learn  $n_F \times n_E$  embedding matrix F with  $n_F$  features and embedding dimension  $n_E$ .
- **entities** are bags of features:
  - ▶ for entity consisting of features  $a = \{1, 2, ..., i, ...\}$ , sum over feature embeddings:

$$\vec{a} = \sum_{i \in a} F_i$$

where  $F_i$  indicates the associated row of F.

#### **Entities and Features**

- features are categorical variables.
  - learn  $n_F \times n_E$  embedding matrix F with  $n_F$  features and embedding dimension  $n_E$ .
- entities are bags of features:
  - ▶ for entity consisting of features  $a = \{1, 2, ..., i, ...\}$ , sum over feature embeddings:

$$\vec{a} = \sum_{i \in a} F_i$$

where  $F_i$  indicates the associated row of F.

▶ Then by construction, entities and features are in the same space.

# StarSpace Negative Sampling Objective

- For entity a selected at current training batch:
  - $\triangleright$  positive sample: related entity b (e.g. two sentences from the same document).
  - ▶ negative samples: k unrelated entities  $b_1^-,...b_k^-$  (e.g. sentences in other documents).

### StarSpace Negative Sampling Objective

- For entity a selected at current training batch:
  - positive sample: related entity *b* (e.g. two sentences from the same document).
  - ▶ negative samples: k unrelated entities  $b_1^-,...b_k^-$  (e.g. sentences in other documents).
- ► Compute vectors  $\vec{a} = \sum_{i \in a} F_i$ ,  $\vec{b}$ ,  $\vec{b}_1^-, ..., \vec{b}_k^-$
- ► Compute cosine similiarities  $sim(\vec{a}, \vec{b}), sim(\vec{a}, \vec{b}_1^-), ..., sim(\vec{a}, \vec{b}_k^-),$

### StarSpace Negative Sampling Objective

- For entity a selected at current training batch:
  - positive sample: related entity *b* (e.g. two sentences from the same document).
  - ▶ negative samples: k unrelated entities  $b_1^-,...b_k^-$  (e.g. sentences in other documents).
- ► Compute vectors  $\vec{a} = \sum_{i \in a} F_i$ ,  $\vec{b}$ ,  $\vec{b}_1^-, ..., \vec{b}_k^-$
- ► Compute cosine similiarities  $sim(\vec{a}, \vec{b}), sim(\vec{a}, \vec{b}_1^-), ..., sim(\vec{a}, \vec{b}_k^-),$
- ▶ Ranking loss objective gives a reward if  $sim(\vec{a}, \vec{b})$  gets a higher rank relative to the negative samples, and gives a penalty if it is lower rank.

# Learning (unsupervised) Sentence Embeddings

#### Directly/Optimally learn sentence embed

Select a pair of sents (s1, s2) from the same doc:

a: s I

b: s2

b-: sampled from sents coming from other docs

- but StarSpace can be used for anything.
- ▶ the trained model can provide similarities between entities, between features, and between entities and features.

### No social science papers with StarSpace

#### But many opportunities:

- embed judicial opinions as bundles of citations
- embed academic articles as bundles of citations
- embed politicians as bundles of roll call votes

# Check for Understanding: True/False

- 1. A limitation of the Arora et al (2017) "tough-to-beat" sentence embeddings is that the vectors do not contain any information about word order.
- 2. Doc2Vec addresses the limits of the Arora et al (2017) embeddings by adding information on word order.
- 3. Unlike the other document embeddings, FastText embeddings (averaged hashed n-gram embeddings) do not have a geometric interpretation.
- 4. StarSpace embeddings could put judges, cases, and words into a single space.
